

Auditory EEG: first-pass estimates and uncertainty

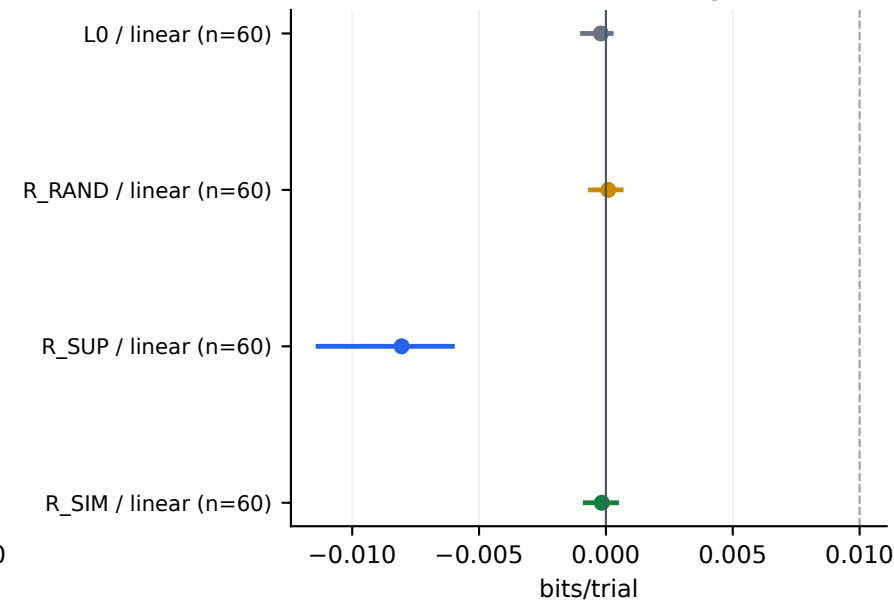

A: response repeatability

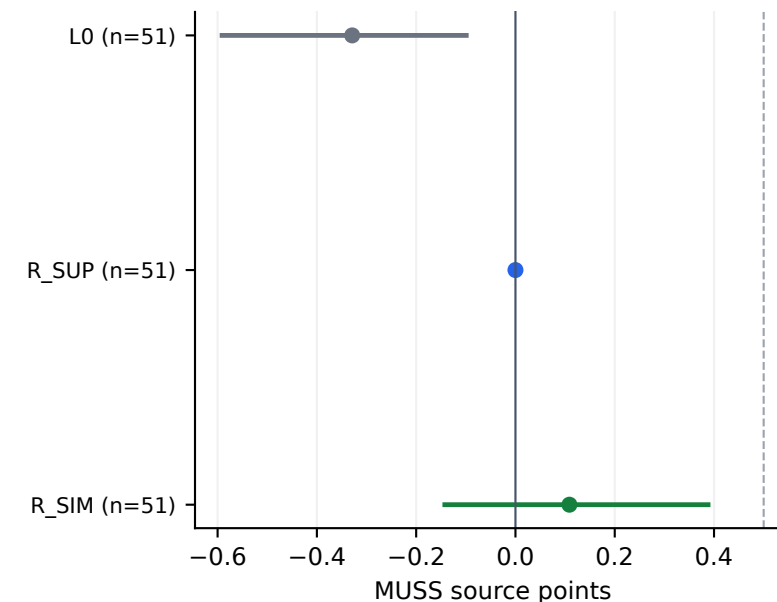

B: conditional history gain

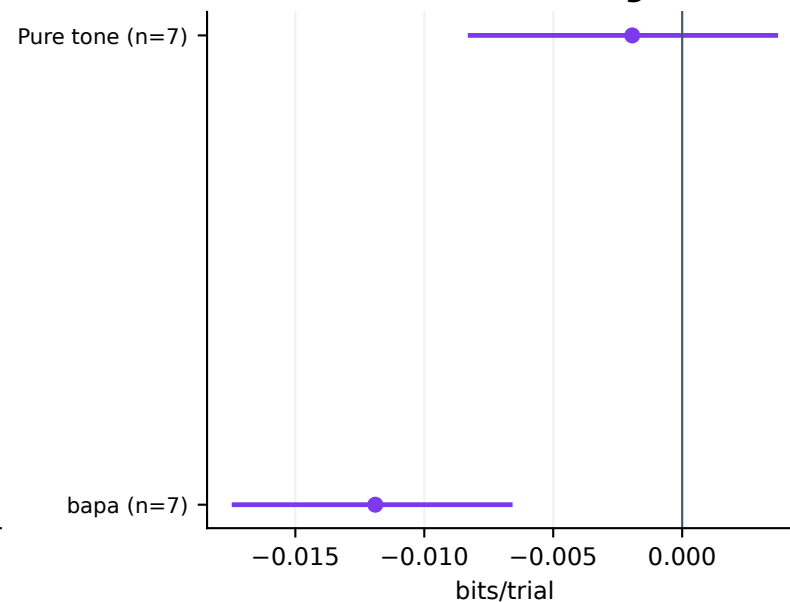

C: sensor complementarity

D: clinical increment

E0: within-record decoding

Exploratory first pass

Points: prespecified readout estimates
Bars: 95% fixed-OOB bootstrap intervals
Dashed lines: screening thresholds

R_SIM is the primary representation.
A lacks history-balanced support.
C linear output does not replace MLP controls.
E0 does not estimate child-level transfer.
Numerical failures are not zero effects.
These cohorts have already been explored.
